

## # Homework 1 Solution

### ## Question 1

#### ### 1a

$/^{(0|1)^*[0]{4,}}\$/$

#### ### 1b

$/^{1^*00^*\$}/$

#### ### 1c

$/^{(10|1)}\$/$

### ## Question 2

$/^{(["^"\backslash n]|\backslash[^ \n])^*}/$

### ## Question 3

#### ### 3a

$L \rightarrow aLb$

$L \rightarrow bb$

#### ### 3b

For  $n = 0$ ,

The  $L \rightarrow bb$  is applicable.

Thus, the string is "bb", which satisfies the condition for  $n = 0$ .

Assume for some  $k \geq 0$ , the CFG generates strings of the form  $(a^k)(b^{(k+2)})$ .

For  $k + 1$ :

By applying  $L \rightarrow aLb$   $k+1$  times we have:

$(a^{(k+1)})L(b^{(k+1)})$

Then, if we apply  $L \rightarrow aLb$  again, we would have more than  $k+1$  a's.

So, we apply  $L \rightarrow bb$ , we have:

$(a^{(k+1)})(b^{(k+3)})$

Which satisfies the condition.

Hence, the CFG describes precisely the language  $L$ .

## ## Question 4

### ### 4a

expr => expr '\$' expr  
=> '(' expr ')' '\$' expr  
=> '(' expr 'then' expr 'else' expr ')' '\$' expr  
=> '(' 1 'then' expr 'else' expr ')' '\$' expr  
=> '(' 1 'then' '#' expr 'else' expr ')' '\$' expr  
=> '(' 1 'then' '#' 2 'else' expr ')' '\$' expr  
=> '(' 1 'then' '#' 2 'else' 3 ')' '\$' expr  
=> '(' 1 'then' '#' 2 'else' 3 ')' '\$' 4

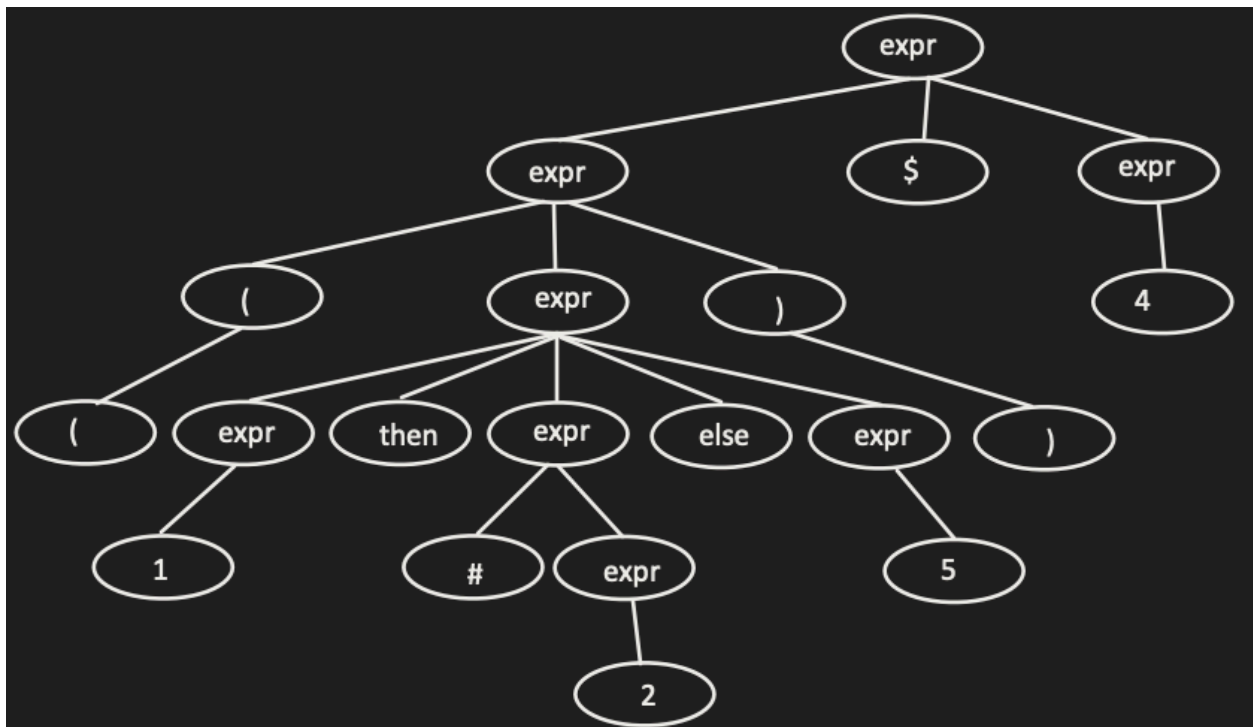

### ### 4b

### 4c

```
expr
: expr 'then' expr 'else' expr2
| expr2
;
expr2
: expr3 '$' expr2
| expr3
;
expr3
: expr4 ':' expr3
| expr4
;
expr4
: '#' expr
| INT
| '(' expr ')'
```

### 4d

### 4e

### 4f

```
expr
: expr2 ( 'then' expr2 'else' expr2 )*
;
expr2
: expr3 ( '$' expr3 )*
;
expr3
: expr4 ( ':' expr4 )*
;
expr4
: ( '#' )* expr
| INT
| '(' expr ')'
;
```

### 4g

```
expr() {  
  expr2()  
  if (peek('then')) {  
    consume('then')  
    expr2()  
    consume('else')  
    expr2()  
  }  
}
```

```
expr2() {  
  expr3()  
  while (peek('$')) {  
    consume('$')  
    expr3()  
  }  
}
```

```
expr3() {  
  expr3()  
  while (peek(':')) {  
    consume(':')  
    expr3()  
  }  
}
```

```
expr4() {  
  if (peek('#')) {  
    consume('#')  
    expr()  
  } else if (peek(INT)) {  
    consume(INT)  
  } else {  
    consume('(')  
    expr()  
    consume(')')  
  }  
}
```

## 5

### 5a

return a + b\*x; //refs to a, b, x.

a: 6

b: 5

x: 2

```
return b + h(a)*x;    //refs to a, b, x.
```

```
a: 3
```

```
b: 3
```

```
x: 2
```

```
return a + g(x);      //refs to a, x.
```

```
a: 1
```

```
x: 2
```

```
### 5b
```

```
//1
```

```
a: <1,0>
```

```
//2
```

```
x: <1,-3>
```

```
//3
```

```
a: <2,0>
```

```
b: <2,1>
```

```
//4
```

```
y: <2,-3>
```

```
//5
```

```
b: <3,0>
```

```
//6
```

```
a: <3,-3>
```

```
### 5c
```

Since  $h()$  has depth 3, and  $x$  has depth 1, the compiler would follow  $(3 - 1 = 2)$  static chains to reach  $x$ 's depth, then offset by -3 to retrieve it.

```
## 6
```

```
### 6a
```

It is possible to support subroutine calls without using a stack. However, there are limitations: difficult to handle nested or recursive calls.

```
### 6b
```

Not totally valid. It is possible to write many arithmetic expressions involving the four binary operators  $+$ ,  $-$ ,  $*$  and  $/$  unambiguously without needing to use parentheses. But without parentheses, we will not be able to write some expressions with precedences overwritten.

```
### 6c
```

It is valid. Some notable languages: C, Java, and Perl5

### 6d

It is valid. "." symbol are used in dotted pairs in Lisp. However, we can also create pairs with the cons functions.

### 6e

Not valid. They are likely be allocated on a heap.
